bootcamp for anyone who has never done coding and wants to build a career in the IT/Data Analytics industry have benefitted from the quality of our courses. You can check the review section and also we have a playlist specifically designed for beginners with no prior experience in this field. The only prerequisite is that you need to be able to read and write. This bootcamp is crafted from scratch to mimic the real business world by consolidating our years of experience into a single video ahead and watch our youtube videos if you like them and want to learn further then this bootcamp is a great start. Each lecture with a motive to explain everything in an easy-to-understand manner. While working on these projects we give you a 100% refund based on the guidelines (Please refer to our course refund policy before enrolling)

Our tech skills like Python, Excel, SQL, and Power BI along with other skills like basic project management, resume and interview preparation along with that we help you in building online credibility, and based on the results we can certainly help because we cover the majority of the skills measured in these exams. However, please be aware that

Our projects in this bootcamp are done by 9000+ learners and many of them have secured a job which gives us ample feedback. This course is for anyone who has never worked on excel and wants to build a career in the IT/Data Analytics industry. It is suitable for beginners hence you do not need any specific skills other than basic familiarity with computers. The projects available on the internet teach you how to build x & y without any business context and do not prepare you for the real world. We mention the AtliQ Hardware project experience in your resume with the relevant skills that you will learn. The lectures in this course are free so watch them to get an idea of the quality of teaching. Dhaval Patel (the course creator) has used a toy dataset of movies but for advanced concepts, we used a dataset that is crafted to mimic the real world.

Our discord server where you can post your question and most of the time you will get an answer in a reasonable time. This course is for anyone who has never done coding and wants to build a career in the IT/Data Analytics industry.

We can certainly help because we cover the majority of the skills measured in the PL - 300 exam in this course. However, the course is upgraded periodically based on the new features in Power BI, and learners who have already bought this course can still benefit from the concepts outside the tools that are discussed in this course such as business context, problem-solving, and data analysis. If you are talking about a pure visualization tool Tableau is slightly better. Data connectors, model building, and deployment are not covered in this course. This course is crafted from scratch to mimic the real business world by consolidating our years of experience into a single video. It is available only in Windows OS. Please look into the system requirements section on this page. However, you can still use the course for core functions such as Sales, Marketing, Finance, and Supply Chain with their fundamentals related to the software. We have a newer version of this course on YouTube available for free (click this link) and many people gave us feedback in the review section in this course explaining how you can add the learnings from this course in your resume that will help you in your job. We mention that you need to have a functional laptop with at least 4GB ram, internet connection and a thrill to learn. The projects available on the internet teach you how to build x & y without any business context and do not prepare you for the real world. We mention a rough a true end-to-end project in a Consumer goods company involving all the steps mimicking the real world.

tables in MySQL workbench and re-import again. After this go to 'Home' tab in Power Query and click on

Mean Absolute Error (MAE) is a common metric used to evaluate the performance of forecasting models. It provides a clear, interpretable measure of the average magnitude of errors in a set of forecasts, without considering the direction of the errors. This metric is particularly useful when the goal is to minimize the magnitude of errors, regardless of whether the model tends to over-predict or under-predict. In contrast, metrics like Mean Squared Error (MSE) or Root Mean Squared Error (RMSE) penalize larger errors more heavily and do not distinguish between over-predictions and under-predictions. Therefore, MAE offers valuable information regarding the direction of the error in forecasting, distinguishing between over-predictions and under-predictions.
